

BAAAM

Scheduling System

Brendan Lambrecht, Andree Lin, Andrew Peirce, Amelia Koch, Manoj Khadka

Important Assumptions

1. Each appointment slot belongs to one service provider, and each booked appointment connects one client with one service provider.
2. Each appointment slot can be booked by only one client on a first-come, first-served basis.
3. Clients cannot book overlapping appointments, and service providers cannot create overlapping appointment slots.
4. Service provider accounts require administrator approval to be active service provider accounts. Verification is done via the admin, after reviewing credential submitted by the service provider in the form of input text.
5. A service provider can be approved to provide services for multiple categories with the same account.
6. A user can have the option to “enhance” their account to change their account from a client or service provider account to a client-service provider account.
7. Appointment slots and appointments use the applicable statuses of Available, Booked, Completed, Canceled, and Missed; service providers manually determine whether appointments are completed or missed.
8. All appointment notifications and reminders are delivered within the website; email, SMS, and phone-call notifications are outside the project scope.
9. The system does not process payments, billing, insurance claims, refunds, or other financial transactions.
10. The system stores scheduling information only and does not store medical records, diagnoses, prescriptions, or confidential medical information.
11. The system does not integrate with external calendars, booking systems, fitness platforms, wearable devices, or health-monitoring devices.
12. Accounts, provider information, appointment slots, bookings, notifications, and appointment history are stored in a database.

Technologies Used

Languages

1. HTML
2. CSS
3. Spec.ts (Testing)
4. TypeScript
5. C# (C Sharp)
6. JSON (for API's)

OS

- On a Per-User Basis
- Since this is a webapp, the OS or Browser Type does not matter

Database

- MongoDB (Atlas)
- Utilizing a DB Cluster for Cloud Storage
- Using MongoDB Compass for Accessibility

IDE

- Visual Studio
- Visual Studio Code
- Postman (API Testing)

Frameworks

- Angular 19 (Frontend)
- ASP .NET Core 10 (Backend)

Division of Teamwork, Version Control & Collaboration

Division of Teamwork

1. Andree Lin (Primary Front-End Dev)
2. Manoj Khadka (Front-End & Backend Dev)
3. Andrew Peirce (Primary Backend Dev)
4. Brendan Lambrecht (Backend & Database Dev)
5. Amelia Koch (Primary Database Dev)

Version Control

- Branch names (Per-Ticket Basis)
- Ticket IDs
- Order of completion

Collaboration

- Divide tasks by each member's primary role
- Communicate async & In-Person weekly
- Coordinate shared features so the interface, back-end logic, and database work in sync.
- Always review code before merging and test integrated features together to identify and resolve issues.

Present Demos
